

Fork Positioner for Forklifts

Forklift Fork Positioners - The fork positioner is actually a hydraulic apparatus which can allow the person driving to be able to control the lift truck without leaving the seat. They are constructed out of high quality materials and are meant to be able to endure the most difficult procedures and work surroundings. Side shifting units have the added ability to laterally position the arms or the entire load in order to facilitate much more precise lifting and placement in a faster and much more efficient method.

The unique blade pocket design enables operators to be able to securely sway the unit's blades without any worry of destroying the positioning cylinders. This can allow the operator the choice to either execute independent or simultaneous blade movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into fork positioners on existing units.
